GIT, Version Control System, Branch, GIT Hub

Version Control System

- Version control is a system that records changes to a file or set of files over time so that you can recall specific versions later.
- If you are a graphic or web designer and want to keep every version of an image or layout (which you would most certainly want to), a Version Control System (VCS) is a very wise thing to use.
- It allows you to revert selected files back to a previous state, revert the entire project back to a previous state, compare changes over time, see who last modified something that might be causing a problem, who introduced an issue and when, and more. Using a VCS also generally means that if you screw things up or lose files, you can easily recover.

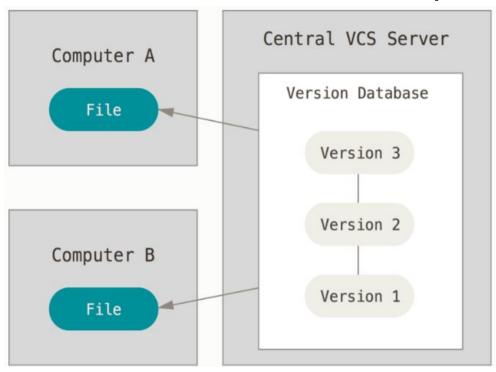

Local Version Control Systems

• Many people's version-control method of choice is to copy files into another directory (perhaps a time-stamped directory, if they're clever). This approach is very common because it is so simple, but it is also incredibly error prone.

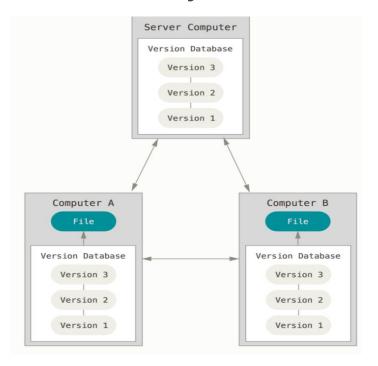

Centralized Version Control Systems

• These systems (such as CVS, Subversion, and Perforce) have a single server that contains all the versioned files, and a number of clients that check out files from that central place.

Distributed Version Control Systems

• In a DVCS (such as Git, Mercurial, Bazaar or Darcs), clients don't just check out the latest snapshot of the files; rather, they fully mirror the repository, including its full history.

• Git is a popular version control system. It was created by Linus Torvalds in 2005, and has been maintained by Junio Hamano since then.

It is used for:

- Tracking code changes
- Tracking who made changes
- Coding collaboration

What does Git do?

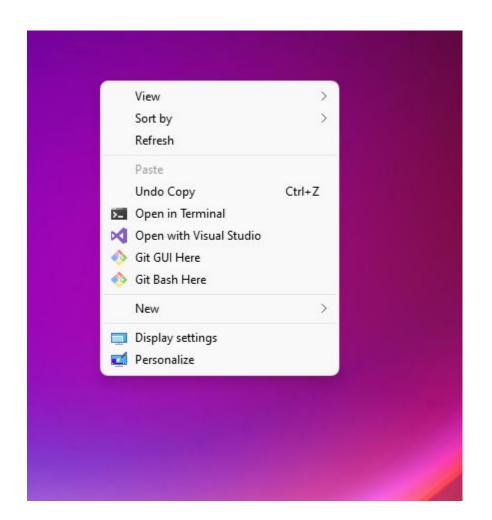

- Manage projects with Repositories
- Clone a project to work on a local copy
- Control and track changes
 with **Staging** and **Committing**
- Branch and Merge to allow for work on different parts and versions of a project
- Pull the latest version of the project to a local copy
- Push local updates to the main project

Why Git?

- Over 70% of developers use Git!
- Developers can work together from anywhere in the world.
- Developers can see the full history of the project.
- Developers can revert to earlier versions of a project.

GIT Installation

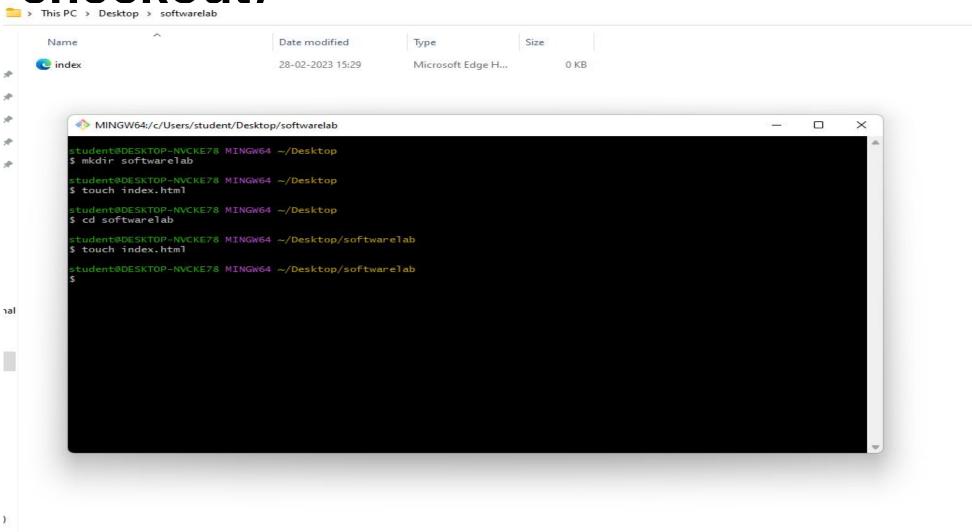

https://git-scm.com/

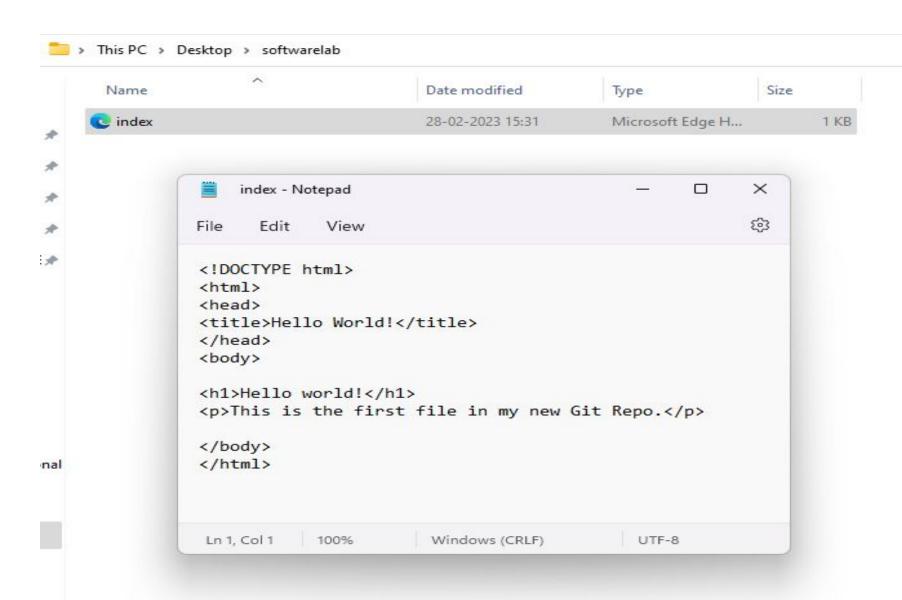

```
student@DESKTOP-NVCKE78 MINGW64 ~
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
$ pwd
/c/Users/student/Desktop
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
$ git config --global user.name "nidhi"
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
$ git config --global user.mail "nidhi.2592@gmail.com"
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
```

```
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop
 pwd
/c/Users/student/Desktop
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
 git config --global user.name "nidhi"
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
 git config --global user.mail "nidhi.2592@gmail.com"
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
 git config --list

student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
```

Git in Action (git - add, status, commit, checkout)

we check the Git status and see if it is a part of our repo:

```
MINGW64:/c/Users/student/Desktop/softwarelab
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
$ touch index.html
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop
$ cd softwarelab
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab
$ touch index.html
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab
$ git init
Initialized empty Git repository in C:/Users/student/Desktop/softwarelab/.git/
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
$ 1s index.html
index.html
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git status
On branch master
No commits yet
Untracked files:
  (use "git add <file>..." to include in what will be committed)
nothing added to commit but untracked files present (use "git add" to track)
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
```

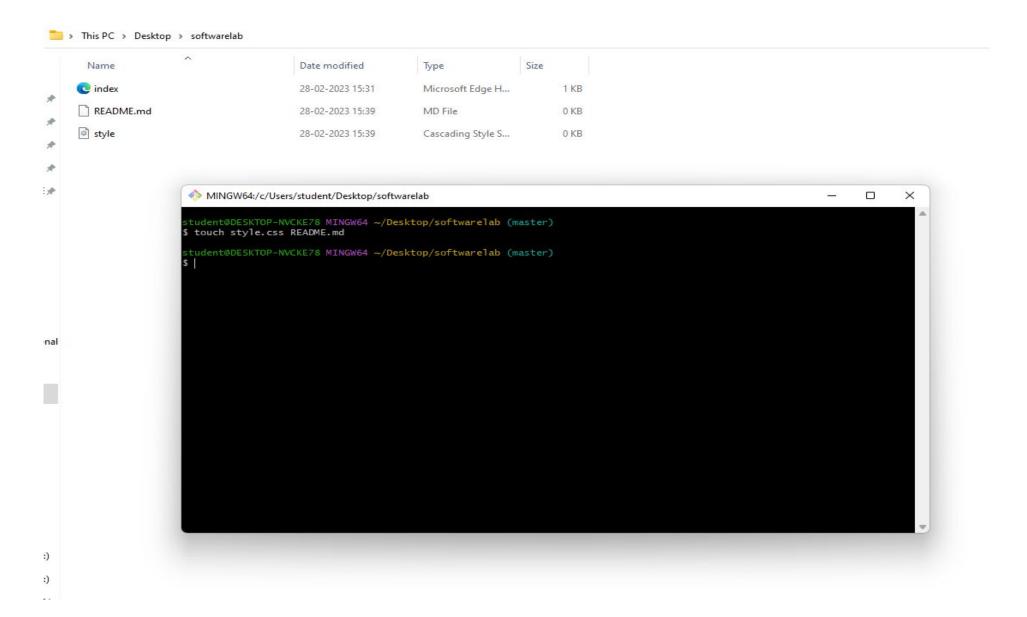

Git Staging Environment

- One of the core functions of Git is the concepts of the Staging Environment, and the Commit.
- As you are working, you may be adding, editing and removing files. But whenever you hit a milestone or finish a part of the work, you should add the files to a Staging Environment.
- Staged files are files that are ready to be committed to the repository you are working on.

- •git add index.html
- •git status

```
MINGW64:/c/Users/student/Desktop/softwarelab
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git add index.html
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git status
On branch master
No commits yet
hanges to be committed:
 (use "git rm --cached <file>..." to unstage)
       new file: index.html
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
```

Git Add More than One File

Now add all files in the current directory to the Staging Environment:

- •git add -all
- •git status

```
MINGW64:/c/Users/student/Desktop/softwarelab
 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
$ touch style.css README.md
 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git add --all
 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git status
On branch master
No commits yet
Changes to be committed:
  (use "git rm --cached <file>..." to unstage)
        new file: README.md
       new file: style.css
 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
```

Git Commit

- Since we have finished our work, we are ready move from stage to commit for our repo.
- Adding commits keep track of our progress and changes as we work. Git considers each commit change point or "save point". It is a point in the project you can go back to if you find a bug, or want to make a change.
- When we commit, we should always include a message.
- By adding clear messages to each commit, it is easy for yourself (and others) to see what has changed and when.

Git Commit

•git commit -m "First commit!"

```
MINGW64:/c/Users/student/Desktop/softwarelab
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
$ git add --all
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
$ git commit -m "First commit!"
[master a7e23a0] First commit!
1 file changed, 1 insertion(+), 2 deletions(-)
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
```

Git Commit Log

• To view the history of commits for a repository, you can use the log

command:

•git log

```
MINGW64:/c/Users/student/Desktop/softwarelab
 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git add --all
 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git commit -m "First commit!"
master a7e23a0] First commit!
1 file changed, 1 insertion(+), 2 deletions(-)
 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)

 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
```

Git Branch

- Branches allow you to work on different parts of a project without impacting the main branch.
- When the work is complete, a branch can be merged with the main project.
- You can even switch between branches and work on different projects without them interfering with each other.
- Branching in Git is very lightweight and fast!

New Git Branch

• Let add some new features to our index.html page.

• We are working in our local repository, and we do not want to disturb or possibly in the main project.

- So we create a new branch:
- •git branch hello-world-images
- •git branch hello-world-images * master

New Git Branch

```
MINGW64:/c/Users/student/Desktop/softwarelab
bash: README.md: command not found
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
$ git branch hello-world-images * master
usage: git branch [<options>] [-r | -a] [--merged] [--no-merged]
  or: git branch [<options>] [-f] [--recurse-submodules] <branch-name> [<start-point>]
  or: git branch [<options>] [-1] [<pattern>...]
  or: git branch [<options>] [-r] (-d | -D) <branch-name>...
  or: git branch [<options>] (-m | -M) [<old-branch>] <new-branch>
  or: git branch [<options>] (-c | -C) [<old-branch>] <new-branch>
  or: git branch [<options>] [-r | -a] [--points-at]
  or: git branch [<options>] [-r | -a] [--format]
Generic options
    -v, --verbose
                         show hash and subject, give twice for upstream branch
                         suppress informational messages
   -q, --quiet
   -t, --track[=(direct|inherit)]
                         set branch tracking configuration
   -u, --set-upstream-to <upstream>
                          change the upstream info
                         unset the upstream info
   --unset-upstream
   --color [=<when>]
                         use colored output
                         act on remote-tracking branches
   -r. --remotes
                         print only branches that contain the commit
    --contains <commit>
    --no-contains <commit>
                          print only branches that don't contain the commit
   --abbrev[=<n>]
                         use <n> digits to display object names
Specific git-branch actions:
   -a. --all
                         list both remote-tracking and local branches
   -d, --delete
                         delete fully merged branch
                         delete branch (even if not merged)
```

checkout is the command used to check out a branch

•git checkout hello-world-images

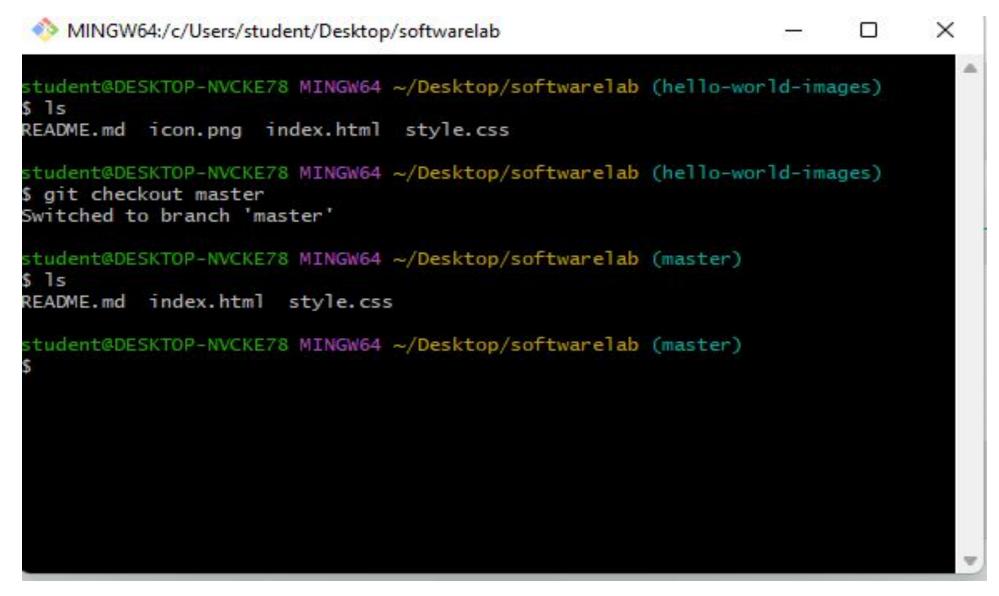

```
MINGW64:/c/Users/student/Desktop/softwarelab
                                                                                 ×
student@DESKTOP-NVCKE78 MINGW64 ~
$ cd Desktop/softwarelab
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
$ git checkout hello-world-images
Switched to branch 'hello-world-images'
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (hello-world-images)
```

Adding file "con.png" is not tracked.

```
MINGW64:/c/Users/student/Desktop/softwarelab
                                                                        tudent@DESKTOP-NVCKE78 MINGW64 ~
$ cd Desktop/softwarelab
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git checkout hello-world-images
Switched to branch 'hello-world-images'
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (hello-world-images)
 git status
On branch hello-world-images
Changes not staged for commit:
 (use "git add <file>..." to update what will be committed)
 (use "git restore <file>..." to discard changes in working directory)
       modified: index.html
Untracked files:
 (use "git add <file>..." to include in what will be committed)
no changes added to commit (use "git add" and/or "git commit -a")
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (hello-world-images)
```

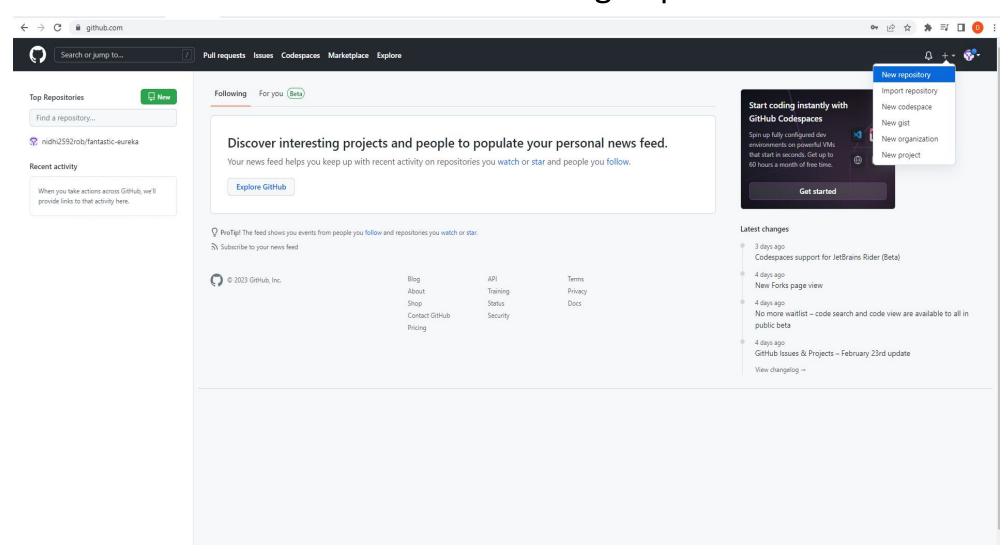

```
MINGW64:/c/Users/student/Desktop/softwarelab
no changes added to commit (use "git add" and/or "git commit -a")
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (hello-world-images)
 git add --all
 tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (hello-world-images)
 git status
On branch hello-world-images
Changes to be committed:
 (use "git restore --staged <file>..." to unstage)
       new file: icon.png
       modified: index.html
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (hello-world-images)
 git commit -m "Added image to Hello World"
[hello-world-images 5a87ef2] Added image to Hello World
2 files changed, 5 insertions(+), 1 deletion(-)
create mode 100644 icon.png
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (hello-world-images)
```

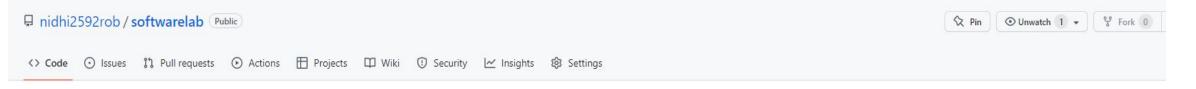

Switching Between Branches

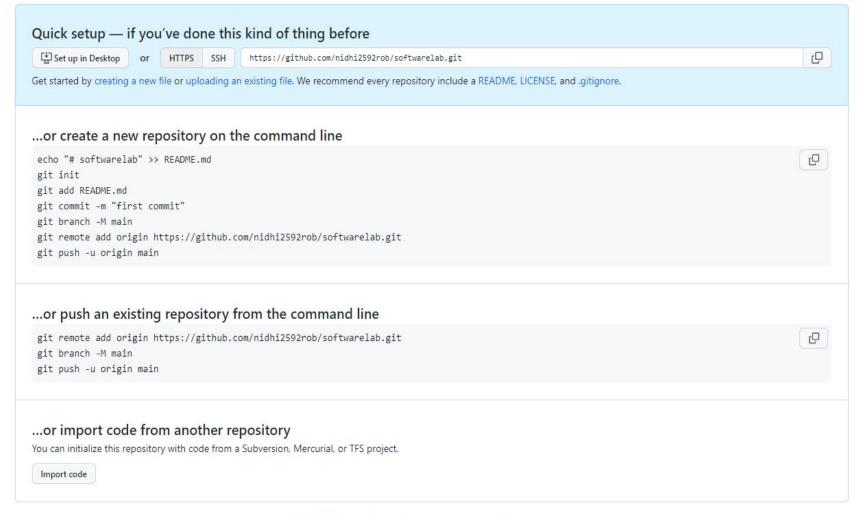

Git and GitHub

GitHub Account: Go to GitHub and sign up for an account:

- git remote set-url origin URL specifies that you are adding a remote repository, with the specified URL, as an origin to your local Git repo.
- URL: https://github.com/nidhi2592rob/softwarelab.git

```
MINGW64:/c/Users/student/Desktop/softwarelab
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
$ git remote set-url origin https://github.com/nidhi2592rob/softwarelab.git
student@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
 git remote -v
origin https://github.com/nidhi2592rob/softwarelab.git (fetch)
origin https://github.com/nidhi2592rob/softwarelab.git (push)
tudent@DESKTOP-NVCKE78 MINGW64 ~/Desktop/softwarelab (master)
$ git help log
$ git push --set-upstream origin master
